Double Pilot Check Spacer/Series FPG

Cylinder mid-stroke, long term retention possible.

The use of the double pilot check spacer equipped with a built-in double check valve enables the cylinder to stop and remain at mid-stroke for long periods regardless of air leakage between the spool and sleeve.

3 Position Double Pilot Check Valve (Wedge packing style) VS7-6-FHG-D-□R

3 position double pilot check valve achieves a reduction in air leakage as a result of main valve construction which features co-axial wedge packing (Max. leakage: 10 cm³/min (ANR)).

⚠ Caution

- Verify that there is no leakage from the pipes between valve and cylinder, and from fittings. Check for leaks by using neutral detergent solution before use. Also check the cylinder packing and the piston packing. If there is leakage, cylinder may not stop at the mid-stroke position, and could move immediately after the valve is de-energized.
- Be aware that if the exhaust side is restricted excessively, the intermediate stopping accuracy will decrease and will lead to improper intermediate stops.

| S (P2=0.5MPa) | B → EB | 18 mm ² | | |

Note 1) Maximum operating pressure of solenoid valve is 0.9 MPa.

Note 2) Be sure to set pressure within setting pressure range of the solenoid valve.

Note 3) Solenoid valve: Max. 50°C

Note 4) Synthesized effective area with 2 position single style solenoid valve.

Note 5) •Supply pressure to interface regulator only from P port except when it is used with reverse pressure style valve.

•Use the ARB210 or ARB310 model to combine a pressure centre valve and the A and B port pressure reduction of a spacer style regulator.

•Use the ARB210 or ARB310 model to combine a reverse pressure valve and a spacer style regulator. The P port pressure reduction cannot be used.

•To use a perfect valve and a spacer style regulator, use a manifold or a sub plate as the standard and stack in the following order: the perfect spacer, spacer style regulator, and the valve.

•When a closed centre valve is combined with the A and B port pressure reduction of a spacer style regulator, it cannot be used for intermediate stops of the cylinder because of the leakage from the relief port of the regulator.

Power Source and Wiring

- Make sure all contacts are secure.
- Voltage should be held within the allowable voltage range.

How to calculate flow rate

Refer to p.0-36 for flow rate calculations.

The manifold Series VV71□ has a wide variety of functions and piping, compatible with virtually any application.

Common EXH Style

Every valve is supplied and exhausted by the same SUP and EXH ports running through the connected manifolds. This is the most popular configuration. When there are 5 or more stations operating simultaneously and pilot back pressure is 0.2kgf/cm² or more, it is recommended that all pilot EXH ports (PE) of the manifold base (4 on U side and 2 on D side, total 6 ports) be open. Also, use "AN110-01" for silencer for pilot EXH.

Multiple Pressure SUP Style

Allows supply of 2 or more different pressure to one manifold.

Put in a gallery blank disc (AXT502-14) between the stations to operate at different pressures. A dual pressure supply can be supplied from both the left and right sides of the manifold. If 3 or more pressures are supplied, the individual SUP spacer should be used.

Bottom Piping Style 1/4, 3/8 (A, B-port)

When side piping appearance is not acceptable or space is limited, either some of, or all ports, can be arranged with bottom piping.

Individual Pilot EXH Style

If there are many valve stations operating at the same time or operation frequency is high, trouble caused by back pressure will be prevented by using individual pilot EXH style valve ("VS7-6-□-□").

Individual EXH Style

Every valve has an independent EXH port of its own.

An Individual EXH spacer (VV71-R-□) mounted on the manifold block allows each valve to exhaust individually.

Individual SUP Style

An Individual SUP spacer (VV71-P-□) mounted on the manifold block allows each valve to be supplied individually.

Main EXH Back Pressure Block Style

If there are many valve stations operating at the same time and main EXH back pressure may cause trouble, mount back pressure block plate ("AXT503-37A") to prevent effects of main EXH back pressure.

Double Pilot Check Spacer/Series FPG

Cylinder mid-stroke/long term retention possible.

The use of the double pilot check spacer equipped with a built-in double check valve enables the cylinder to stop and remain at mid-stroke for long periods regardless of air leakage between the spool and sleeve.

3 Position Double Pilot Check Valve (Wedge packing style)

VS7-8-FHG-D-□R

3 position double pilot check valve achieves a reduction in air leakage as a result of main valve construction which features co-axial wedge packing (Max. leakage: 10 cm³/min (ANR)).

⚠ Caution

- Verify that there is no leakage from the pipes between valve and cylinder, and from fittings. Check for leaks by using neutral detergent solution before use. Also check the cylinder packing and the piston packing. If there is leakage, cylinder may not stop at the mid-stroke position, and could move immediately after the valve is de-energized.
- Be aware that if the exhaust side is restricted excessively, the intermediate stopping accuracy will decrease and will lead to improper intermediate stops.

Check Valve/Operation Pressure Characteristics

The check valve will operate correctly providing that cylinder side pressure is not in excess of two times the supply pressure.

Note 1) Maximum operating pressure of solenoid valve is 0.9 MPa.

Note 2) Be sure to set pressure within setting pressure range of the solenoid valve.

Note 3) Solenoid valve: Max. 50°C

Note 4) Synthesized effective area with 2 position single style solenoid valve.

Note 5) •Supply pressure to interface regulator only from P port except when it is used with reverse pressure style valve.

- Use the ARB210 or ARB310 model to combine a pressure centre valve and the A and B port pressure reduction of a spacer style regulator.
- Use the ARB210 or ARB310 model to combine a reverse pressure valve and a spacer style regulator. The P port pressure reduction cannot be used.
- To use a perfect valve and a spacer style regulator, use a manifold or a sub plate as the standard and stack in the following order: the perfect spacer, spacer style regulator, and the valve.
- When a closed centre valve is combined with the A and B port pressure reduction of a spacer style regulator, it cannot be used for intermediate stops of the cylinder because of the leakage from the relief port of the regulator.

Series VS7-8 Manifold

Manifold: Series VV72

Note:

Please note that single subplates and manifolds have changed colour from platinum silver to white as standard. Valves will remain platinum silver.

| | | AXT512-14-2A (for R1, R2 port) |

The manifold Series VV72□ has a wide variety of functions and porting compatible with virtually any application need.

Common EXH Style

Every valve is supplied and exhausted by the same SUP and EXH ports running through the connected manifolds. This is the most popular configuration. When there are 5 or more stations operating simultaneously and pilot back pressure is 0.2kgf/cm² or more, it is recommended that all pilot EXH ports (PE) of the manifold base (4 on U side and 2 on D side, total 6 ports) be opened. Also, use "AN110-01" for silencer for pilot EXH.

V Type

V type allows combinations with valves of varying body size. (Interface adapter plate VV72-V-1)

Main EXH Back Pressure Block Style

¡f there are many valve stations operating at the same time and main EXH back pressure may cause trouble, mount back pressure block plate ("AXT503-37A") to prevent effects of main EXH back pressure.

Individual EXH Style

Every valve has an independent EXH port of its own.

¡An individual EXH spacer (VV72-R-03, 04) mounted on the manifold block allows each valve to exhaust individually.

Individual SUP Style

¡An individual SUP spacer (VV72-P-03, 04) mounted on the manifold-block allows each valve to be supplied individually.

Multiple Pressure SUP Style

Allows supply of 2 or more different pressures to one manifold.

¡Put in a gallery blank disc (AXT512-14-1A) between the stations to operate at different pressures. When using a dual pressures supply, the pressure can be supplied from both the left and right sides of the manifold. If 3 or more pressures are supplied, pressure should be supplied from the spacer (VV72-P-□) port.

Bottom Piping Style (3/8, 1/2)

When side piping appearance is not acceptable or space is limited, bottom piping for A or B ports is possible.

Individual Pilot EXH Style

¡f there are many valve stations operating at the same time or operation frequency is high, trouble caused by back pressure will be prevented by using individual pilot EXH style valve ("VS7-8-□-□V").
