# 2 Port Solenoid Valve with Built-in Y-strainer

For Air, Water, Oil, Steam

60 mm (vxк21) 63.5 mm (vxк22/23)

Space saving and reduced piping labor

Built-in strainer enabling the removal of contaminants

Strainer (100 mesh)

Restriction of environmentally hazardous substances ROHS compliant

Other combinations	С	PTFE	PTFE C37/Cu				
Jote 1) The leakage amount (10 <sup>-6</sup> Pa·m <sup>3</sup> /s) of the option "V" is a value when the differential pressure is 0.1 MPa. Jote 2) Option "V" is the oil-free treatment. Jote 3) The dynamic viscosity of the fluid must not exceed 50 mm <sup>2</sup> /s. The special construction of the armature adopted in the built-in full-wave rectifier type gives an improvement in OFF response by providing clearance on the absorbed sur-							

The special construction of the armature adopted in the built-in full-wave rectifier type gives an improvement in OFF response by providing clearance on the absorbed surface when it is switched ON.

Select the DC spec. or AC spec. built-in full-wave rectifier type when the dynamic viscosity is higher than water or when the OFF response is prioritized. Note 4) Coil insulation type Class H: AC spec. only

Note 5) There is no shading coil attached to the DC spec. or AC spec. built-in full-wave rectifier type.

\* Please contact SMC when fluids other than above are used.

## Model/Valve Specifications

NI	<b>^</b>
IN	. <b>U</b> .

N.O.

Passage symbol

When you operate the **VXK** series (AC spec.) by air, the built-in full-wave rectifier type is chosen.

- The special construction of the armature reduces abrasion, resulting in a longer service life.
- Noise reduction

Best suited for medical equipment, low-noise environments, etc.

Model/Valve Specifications

## 🕂 Fluid: Oil ——

The dynamic viscosity of the fluid must not exceed 50 mm<sup>2</sup>/s.

The special construction of the armature adopted in the built-in full-wave rectifier type gives an improvement in OFF response by providing clearance on the absorbed surface when it is switched ON.

Select the DC spec. or AC spec. built-in full-wave rectifier type when the dynamic viscosity is higher than water or when the OFF response is prioritized.

# **Solenoid Valve Flow Characteristics** (How to indicate flow characteristics)

## 1. Indication of flow characteristics

The flow characteristics in equipment such as a solenoid valve, etc. are indicated in their specifications as shown in the Table (1).

## Table (1) Indication of flow characteristics

Corresponding equipment	Indication by international standard	Other indications	Conformed standard					
Pneumatic	<i>C</i> , <i>b</i>		ISO 6358: 1989 JIS B 8390: 2000					
equipment	_	S	JIS B 8390: 2000 Equipment: JIS B 8373, 8374, 8375, 8379, 8381					
		Cv	ANSI/(NFPA)T3.21.3: 1990					
Process fluid control	Av	_	IEC60534-2-3: 1997 JIS B 2005: 1995					
equipment	_	Cv	Equipment: JIS B 8471, 8472, 8473					

## 2. Pneumatic equipment

## 2.1 Indication according to the international standards

2.1 Indication ac	cording to the international standards
(1) Conformed stand	lard
ISO 6358: 198	9 : Pneumatic fluid power—Components using compressible fluids— Determination of flow-rate characteristics
JIS B 8390: 2	000 : Pneumatic fluid power—Components using compressible fluids— How to test flow-rate characteristics
(2) Definition of flow	characteristics
The flow charact	eristics are indicated as a result of a comparison between sonic conductance C and critical pressure ratio h.
Sonic conductar	ce <b>C</b> : Value which divides the passing mass flow rate of an equipment in a choked flow condition by the product of the upstream absolute pressure and the density in a standard condition.
Critical pressure	ratio <b>b</b> : Pressure ratio (downstream pressure/upstream pressure) which will turn to a choked flow when the value is smaller than this ratio.
Choked flow	: The flow in which the upstream pressure is higher than the downstream pressure and where sonic speed in a certain part of an equipment is reached.
	Gaseous mass flow rate is in proportion to the upstream pressure and not dependent on the downstream pressure.
Subsonic flow	: Flow greater than the critical pressure ratio
Standard conditi	on : Air in a temperature state of 20°C, absolute pressure 0.1 MPa (= 100 kPa = 1 bar), relative humidity 65%.
	It is stipulated by adding the "(ANR)" after the unit depicting air volume. (standard reference atmosphere)
	Conformed standard: ISO 8778: 1990 Pneumatic fluid power—Standard reference
	atmosphere, JIS B 8393: 2000: Pneumatic fluid power—Standard reference atmosphere
(3) Formula for flow	rate

It is described by the practical units as following.

When  $\frac{P_{2} + 0.1}{P_{1} + 0.1} \le b, \text{ choked flow}$   $Q = 600 \times C (P_{1} + 0.1) \sqrt{\frac{293}{273 + t}} \dots (1)$ When  $\frac{P_{2} + 0.1}{P_{1} + 0.1} > b, \text{ subsonic flow}$   $Q = 600 \times C (P_{1} + 0.1) \sqrt{\left[1 - \left(\frac{P_{2} + 0.1}{P_{1} + 0.1} - b\right)^{2} \sqrt{\frac{293}{273 + t}} \dots (2)\right]}$ 

Q: Air flow rate [dm<sup>3</sup>/min (ANR)], dm<sup>3</sup> (Cubic decimeter) of SI unit are also allowed to be described by  $\ell$  (liter). 1 dm<sup>3</sup> = 1  $\ell$ 

C : Sonic conductance [dm<sup>3</sup>/(s·bar)]

- **b** : Critical pressure ratio [—]
- P1 : Upstream pressure [MPa]
- **P2** : Downstream pressure [MPa]

*t* : Temperature [°C]

Note) Formula of subsonic flow is the elliptic analogous curve.

Flow characteristics are shown in Graph (1) For details, please make use of SMC's "Energy Saving Program".

#### Example)

Obtain the air flow rate for  $P_1 = 0.4$  [MPa],  $P_2 = 0.3$  [MPa], t = 20 [°C] when a solenoid value is performed in C = 2 [dm<sup>3</sup>/(s·bar)] and b = 0.3.

According to formula 1, the maximum flow rate =  $600 \times 2 \times (0.4 + 0.1) \times \sqrt{\frac{293}{273 + 20}} = 600 \text{ [dm<sup>3</sup>/min (ANR)]}$ 

Pressure ratio =  $\frac{0.3 + 0.1}{0.4 + 0.1} = 0.8$ 

Based on Graph (1), it is going to be 0.7 if it is read by the pressure ratio as 0.8 and the flow rate ratio to be  $\boldsymbol{b} = 0.3$ . Hence, flow rate = maximum flow rate x flow rate ratio = 600 x 0.7 = 420 [dm<sup>3</sup>/min (ANR)]

Graph (1) Flow characteristics

#### (4) Test method

Attach a test equipment with the test circuit shown in Fig. (1) while maintaining the upstream pressure to a certain level which does not go below 0.3 MPa. Next, measure the maximum flow to be saturated in the first place, then measure this flow rate at 80%, 60%, 40%, 20% and the upstream and downstream pressure. And then, obtain the sonic conductance C from this maximum flow rate. Besides that, substitute each data of others for the subsonic flow formula to find b, then obtain the critical pressure ratio b from that average.

2.2 Effective area S (1) Conformed standard JIS B 8390: 2000: Pneumatic fluid power—Components using compressible fluids— Determination of flow rate characteristics Equipment standards: JIS B 8373: 2 port solenoid valve for pneumatics JIS B 8374: 3 port solenoid valve for pneumatics JIS B 8375: 4 port, 5 port solenoid valve for pneumatics JIS B 8379: Silencer for pneumatics JIS B 8381: Fittings of flexible joint for pneumatics (2) Definition of flow characteristics Effective area S: The cross-sectional area having an ideal throttle without friction deduced from the calculation of the pressure changes inside an air tank or without reduced flow when discharging the compressed air in a choked flow, from an equipment attached to the air tank. This is the same concept representing the "easy to run through" as sonic conductance C. (3) Formula for flow rate When  $\frac{P_2 + 0.1}{P_1 + 0.1} \le 0.5$ , choked flow  $Q = 120 \times S(P_1 + 0.1) \sqrt{\frac{293}{273 + t}}$  (3) When  $\frac{P_{2}+0.1}{P_{1}+0.1} > 0.5, \text{ subsonic flow}$   $Q = 240 \times S \sqrt{(P_{2}+0.1) (P_{1}-P_{2})} \sqrt{\frac{293}{273+t}}$ (4) Conversion with sonic conductance C: Q : Air flow rate[dm<sup>3</sup>/min(ANR)], dm<sup>3</sup> (cubic decimeter) of SI unit are also allowed to be described by  $\ell$  (liter). 1 dm<sup>3</sup> = 1  $\ell$ S : Effective area [mm<sup>2</sup>] P1 : Upstream pressure [MPa] P2 : Downstream pressure [MPa] : Temperature [°C] Note) Formula for subsonic flow (4) is only applicable when the critical pressure ratio  $\boldsymbol{b}$  is the unknown equipment. In the formula (2) by the sonic conductance C, it is the same formula as when b = 0.5. (4) Test method Attach a test equipment with the test circuit shown in Fig. (2) in order to discharge air into the atmosphere until the pressure inside the air tank goes down to 0.25 MPa (0.2 MPa) from an air tank filled with the compressed air at a certain pressure level (0.5 MPa) which does not go below 0.6 MPa. At this time, measure the discharging time and the residual pressure inside the air tank which had been left until it turned to be the normal values to determine the effective area S, using the following formula. The volume of an air tank should be selected within the specified range by corresponding to the effective area of an equipment for test. In the case of JIS B 8373, 8374, 8375, 8379, 8381, the pressure values are in parentheses and the coefficient of the formula is 12.9.  $S = 12.1 \frac{V}{t} \log_{10} \left( \frac{Ps + 0.1}{P + 0.1} \right) \sqrt{\frac{293}{T}} \dots (6)$ S : Effective area [mm<sup>2</sup>] • Power supply V : Air tank capacity [dm<sup>3</sup>] Pressure switch Thermometer t : Discharging time [s] Control Pressure control Solenoid valve

- **Ps** : Pressure inside air tank before discharging [MPa]
- P : Residual pressure inside air tank after discharging [MPa]
- T : Temperature inside air tank before discharging [K]

### 2.3 Flow coefficient Cv factor

The United States Standard ANSI/(NFPA)T3.21.3:1990: Pneumatic fluid power—Flow rating test procedure and reporting method for fixed orifice components

Defines the *Cv* factor of flow coefficient by the following formula which is based on the test conducted by the test circuit analogous to ISO 6358.

$$Cv = \frac{Q}{114.5 \sqrt{\frac{\Delta P (P_2 + P_a)}{T_1}}}$$
(7)

△*P* : Pressure drop between the static pressure tapping ports [bar]

- **P1** : Pressure of the upstream tapping port [bar gauge]
- **P2** : Pressure of the downstream tapping port [bar gauge]:  $P_2 = P_1 \Delta P$
- **Q** : Flow rate [dm<sup>3</sup>/s standard condition]
- Pa : Atmospheric pressure [bar absolute]
- T1 : Upstream absolute temperature [K]

Test conditions are  $P1 + Pa = 6.5 \pm 0.2$  bar absolute,  $T1 = 297 \pm 5$ K, 0.07 bar  $\leq \Delta P \leq 0.14$  bar.

This is the same concept as effective area  $\mathbf{A}$  which ISO 6358 stipulates as being applicable only when the pressure drop is smaller than the upstream pressure and the compression of air does not become a problem.

## 3. Process fluid control equipment

(1) Conformed standard

IEC60534-2-3: 1997: Industrial process control valves. Part 2: Flow capacity, Section Three-Test procedures JIS B 2005: 1995: Test method for the flow coefficient of a valve Equipment standards: JIS B 8471: Solenoid valve for water

JIS B 8472: Solenoid valve for steam

JIS B 8473: Solenoid valve for fuel oil

- (2) Definition of flow characteristics
  - Av factor: Value of the clean water flow rate represented by m<sup>3</sup>/s which runs through a valve (equipment for test) when the pressure difference is 1 Pa. It is calculated using the following formula.

$$\boldsymbol{A}\boldsymbol{v} = \boldsymbol{Q}_{\sqrt{\frac{\rho}{\Delta \boldsymbol{P}}}}$$
(8)

Av: Flow coefficient [m2]

- **Q** : Flow rate [m<sup>3</sup>/s]
- $\Delta \mathbf{P}$  : Pressure difference [Pa]

 $\rho$  : Density of fluid [kg/m<sup>3</sup>]

(3) Formula of flow rate

It is described by the practical units. Also, the flow characteristics are shown in Graph (2). In the case of liquid:

$$\boldsymbol{Q} = 1.9 \times 10^6 \boldsymbol{A} \boldsymbol{v}_{\sqrt{\frac{\Delta \boldsymbol{P}}{\boldsymbol{G}}}}$$
(9)

- **Q** : Flow rate [*l*/min]
- Av: Flow coefficient [m<sup>2</sup>]
- $\Delta P$  : Pressure difference [MPa]

**G** : Specific gravity [water = 1]

In the case of saturated steam:

$$Q = 8.3 \times 10^6 A v_1 / \Delta P (P_2 + 0.1)$$
 .....(10)

**Q** : Flow rate [kg/h]

Av: Flow coefficient [m<sup>2</sup>]

 $\Delta P$  : Pressure difference [MPa]

 $P_1$ : Upstream pressure [MPa]:  $\Delta P = P_1 - P_2$ 

**P**<sub>2</sub> : Downstream pressure [MPa]

Conversion of flow coefficient:  $Av = 28 \times 10^{-6} Kv = 24 \times 10^{-6} Cv$  .....(11) Here

Kv factor: Value of the clean water flow rate represented by m<sup>3</sup>/h which runs through a valve at 5 to 40°C, when the pressure difference is 1 bar.

Cv factor (Reference values): Value of the clean water flow rate represented by US gal/min which runs through a valve at 60°F, when the pressure difference is 1 lbf/in<sup>2</sup> (psi).

Value is different from *Kv* and *Cv* factors for pneumatic purpose due to different test method.

Graph (2) Flow characteristics

Example 1)

Obtain the pressure difference when water 15 [ $\ell$ /min] runs through a solenoid valve with an  $Av = 45 \times 10^{-6} \text{ [m}^2\text{]}$ . Since Qo = 15/45 = 0.33 [ $\ell$ /min], according to Graph (2), if reading  $\Delta P$  when Qo is 0.33, it will be 0.031 [MPa].

### Example 2)

Obtain the saturated steam flow rate when  $P_1 = 0.8$  [MPa],  $\Delta P = 0.008$  [MPa] with a solenoid valve with an  $Av = 1.5 \times 10^{-6}$  [m<sup>2</sup>]. According to Graph (2), if reading  $Q_0$  when  $P_1$  is 0.8 and  $\Delta P$  is 0.008, it is 0.7 [kg/h]. Hence, the flow rate  $Q = 0.7 \times 1.5 = 1.05$  [kg/h].

#### (4) Test method

Attach a test equipment with the test circuit shown in Fig. (3). Next, pour water at 5 to 40°C, then measure the flow rate with a pressure difference of 0.075 MPa. However, the pressure difference needs to be set with a large enough difference so that the Reynolds number does not go below a range of  $4 \times 10^4$ .

By substituting the measurement results for formula (8) to figure out Av.

SMC

Fig. (3) Test circuit based on IEC60534-2-3, JIS B 2005

# **Flow Characteristics**

Note) Use this graph as a guide. In the case of obtaining an accurate flow rate, refer to pages 16 to 20.

## How to read the graph

The sonic range pressure to generate a flow rate of 500 t/min (ANR) is

 $P_{1}\approx 0.14~MPa$  for a ø6 orifice (VXK2 $_{2}^{3}4\Box)$  and

 $P_1\approx 0.3$  MPa for a ø4.5 orifice (VX2 $\Box 3\Box$ ).

## Saturated Steam

## How to read the graph

The sonic range pressure to generate a flow rate of 15 kg/h is

 $P_1 \approx 0.15$  MPa for ø4.5 orifice (VXK2 $\square$ 3 $\square$ S),  $P_1 \approx 0.37$  MPa for ø3 orifice (VXK2 $\square$ 2 $\square$ S), and

P1 ≈ 0.82 MPa for Ø2 orifice (VXK211□S). The holding heat slightly differs depending on the pressure P1, but at 15 kg/h it is approx. 9700 kcal/h.

(): Saturated steam holding heat (kcal/kg) (): Saturation temperature (°C)

## **Flow Characteristics**

## How to read the graph

When a water flow of 2 d/min is generated,  $\triangle P \approx 0.017$  MPa for a valve with ø3 orifice (VXK212 $\square$ , 222 $\square$ , 232 $\square$ ).

# **Glossary of Terms**

## Pressure Terminology

## 1. Maximum operating pressure differential

The maximum pressure differential (the difference between the inlet and outlet pressure) which is allowed for operation. When the outlet pressure is 0 MPa, this becomes the maximum operating pressure.

#### 2. Minimum operating pressure differential

The minimum pressure differential (the difference between the inlet pressure and outlet pressure) required to keep the main valve stably operating.

#### 3. Maximum system pressure

The maximum pressure that can be applied inside the pipelines (line pressure).

(The pressure differential of the solenoid valve portion must be less than the maximum operating pressure differential.)

#### 4. Proof pressure

The pressure in which the valve must be withstood without a drop in performance after holding for one minute under prescribed pressure and returning to the operating pressure range. (value under the prescribed conditions)

#### 5. 100 mesh

The number of meshes over a length of 25.4 mm (1 inch).

## Electrical Terminology

#### 1. Apparent power (VA)

Volt-ampere is the product of voltage (V) and current (A). Power consumption (W): For AC ,  $W = V \cdot A \cdot \cos\theta$ . For DC,  $W = V \cdot A$ . Note)  $\cos\theta$  shows power factor.  $\cos\theta = 0.6$ 

#### 2. Surge voltage

A high voltage which is momentarily generated by shutting off the power in the shut-off area.

#### 3. Enclosure

A degree of protection defined in the "JIS C 0920: Waterproof test of electric machinery/appliance and the degree of protection against the intrusion of solid foreign objects".

Verify the degree of protection for each product.

## Second characteristic numeral First characteristic numeral

.. . .

#### • First Characteristics:

L	Degrees of protection against solid foreign objects					
0	Non-protected					
1	Protected against solid foreign objects of 50 mm ø and greater					
2	Protected against solid foreign objects of 12 mm ø and greater					
3	Protected against solid foreign objects of 2.5 mm ø and greater					
4	Protected against solid foreign objects of 1.0 mm ø and greater					
5	Dust-protected					
6	Dusttight					

#### Second Characteristics: Degrees of protection against water

	- <b>J J</b>	
0	Non-protected	—
1	Protected against vertically falling water drops	Dripproof type 1
2	Protected against vertically falling water drops when enclosure tilted up to $15^\circ$	Dripproof type 2
3	Protected against rainfall when enclosure tilted up to 60°	Rainproof type
4	Protected against splashing water	Splashproof type
5	Protected against water jets	Low jetproof type
6	Protected against powerful water jets	Strong jetproof type
7	Protected against the effects of temporary immersion in water	Immersible type
8	Protected against the effects of continuous immersion in water	Submersible type

Example) IP65: Dusttight, Low jetproof type

"Low jetproof type" means that no water intrudes inside an equipment that could hinder from operating normally by means of applying water for 3 minutes in the prescribed manner. Take appropriate protection measures, since a device is not usable in an environment where a droplet of water is splashed constantly.

#### Others

## 1. Material

NBR: Nitrile rubber FKM: Fluororubber – Trade names: Viton®, Dai-el®, etc. EPDM: Ethylene propylene rubber PTFE: Polytetrafluoroethylene resin – Trade names: Teflon®, Polyflon®, etc.

## 2. Oil-free treatment

The degreasing and washing of wetted parts.

### 3. Passage symbol

In the JIS symbol ( $\not = \Pi \stackrel{+}{\to} \end{pmatrix}$ ) IN and OUT are in a blocked condition ( $\dot{-}$ ), but actually in the case of reverse pressure (OUT>IN), there is a limit to the blocking.

 $(\boldsymbol{\varphi})$  is used to indicate that blocking of reverse pressure is not possible.

## Series VXK Specific Product Precautions 1

Be sure to read before handling. Refer to back cover for Safety Instructions, "Handling Precautions for SMC Products" (M-E03-3) for 2 Port Solenoid Valves for Fluid Control Precautions.

## **Replacement of Strainer**

## **Warning**

1. The valve will reach high temperatures from high temperature fluids such as steam. Confirm that the valve has cooled sufficiently before performing works.

If touched inadvertently, there is a danger of being burned.

- 2. Shut off the fluid supply and release the fluid pressure in the system.
- 3. Shut off the power supply.

- 1)Turn and remove the plug (width across flats of 27 mm).
- 2) Remove the strainer, and clean or replace it.
- 3) Mount the O-ring on the plug and insert the strainer to the end of the plug.
- 4) Screw the plug into the body. (Recommended tightening torque: 23 to 27 N⋅m)

## Series VXK Specific Product Precautions 2

Be sure to read before handling. Refer to back cover for Safety Instructions, "Handling Precautions for SMC Products" (M-E03-3) for 2 Port Solenoid Valves for Fluid Control Precautions.

- 1. When replacing the solenoid coil, turn off the power supply.
- 2. Be careful for possible high temperature of the solenoid coil due to the fluid temperature and operating conditions.
- 3. Check the type of the solenoid coil (size, rated voltage, voltage specification, insulation specification).
  - \* Replacement of solenoid coil
  - Cannot be changed between DC and AC.
  - · Cannot be changed between DC and AC (built-in full-wave rectifier type).
  - Can be changed from DC to DC.
  - Can be changed from AC to AC.

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of "**Caution**," "**Warning**" or "**Danger**." They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)<sup>\*1</sup>, and other safety regulations.

4. Use in an interlock circuit, which requires the provision of double interlock for possible failure by using a mechanical protective function, and periodical checks to confirm proper operation.

#### **Revision history**

in the transaction. Prior to the shipment of a SMC product to another country,

assure that all local rules governing that export are known and followed.

Edition B \* Addition of plug assembly part no. to strainer part no. \* Change of O-ring part no. in strainer part no.
